Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Notice to readers

Most of the components used to produce preliminary population estimates are estimated using demographic models or based on data sources less complete or reliable, albeit more timely, than those used for updated or final estimates.

3.	Quarterly aggregated demographic components, July to September, 1973 to 2007, Canada	11

Highlights

- In the third quarter, Canada's population passed the 33-million mark for the first time; on October 1, 2007, the estimated figure stood at 33,091,200.
- Canada welcomed 71,600 immigrants during July, August and September. Since 1971, that number has been surpassed only once in a third quarter (75,900 in 2005).
- Ontario's attraction for newcomers is declining. Over the last quarter, 46.5% of new arrivals settled in Ontario—the lowest percentage since the second quarter of 1984 (46.0%).
- A trend reversal in interprovincial migration was observed over the quarter. For the first time since the fourth quarter of 1994, Alberta posted negative net interprovincial migration (-3,300).
- Thanks to this change, all provinces other than Alberta recorded positive demographic growth higher than that for the same period of 2006.
- For the first time in several decades, Saskatchewan had the highest demographic growth among all Canadian jurisdictions, with the province's population topping the one-million mark for the first time since July 1, 2001.
- With gains of 1,200, Newfoundland and Labrador ended a series of 15 consecutive quarters of demographic losses, and Manitoba experienced its highest demographic increase since the second quarter of 1983.

Analysis

Canada's population passed the 33-million mark over the last three months, standing at 33,091,200 on October 1, 2007. This represents a rise of 115,200 in relation to July 1, 2007, and, in absolute numbers, the strongest quarterly demographic growth since 1971. The demographic growth rate for the last quarter of 2007 (0.35%) is the highest for a third quarter since 2001 (0.37%).

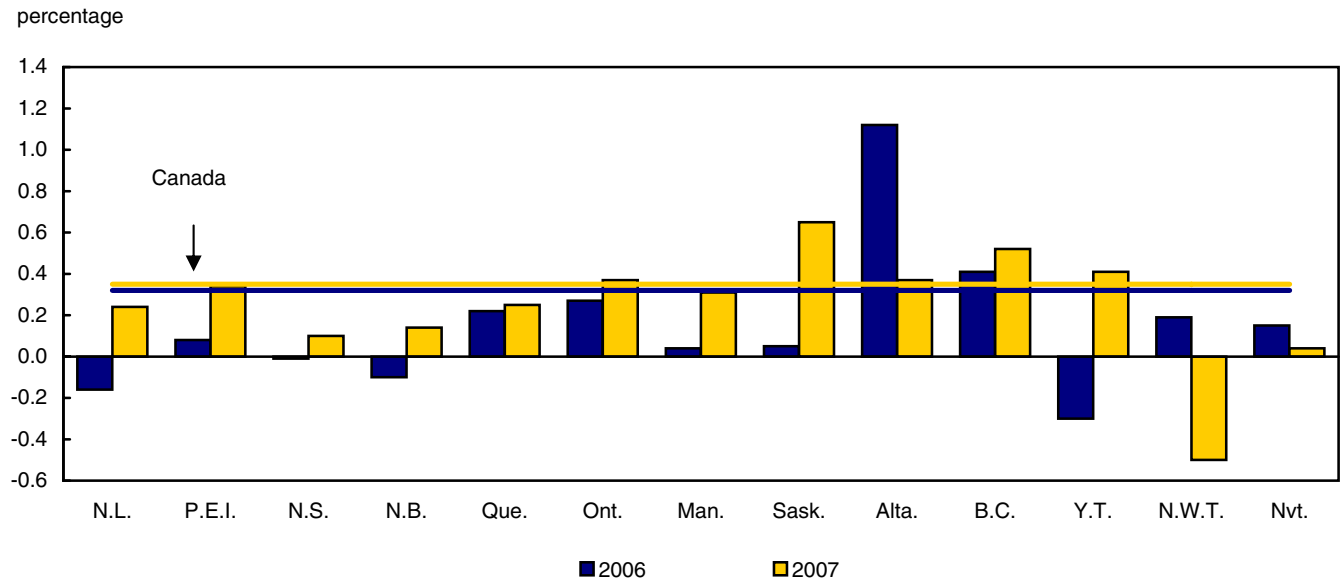

Canada's overall natural growth up slightly...

The natural growth observed over the past three months (+37,500) is up slightly over the third quarter of 2006 (+37,200). Taking account solely of third quarters, the excess in the number of births over deaths has not been as high since 1999 (+37,600). The rise in births observed over the past few years has been offset, however, by an increased number of deaths, which is normal given the greying of the population.

... But increasingly less so in the Atlantic region

Natural growth is not the same everywhere in the country: while it rose more perceptibly in Quebec and British Columbia, it is lower in the Atlantic provinces. Despite the fact that the third quarter usually posts the highest natural growth, the rate in Newfoundland and Labrador was negative—the fourth negative quarter for this province.

Chart 1
Quarterly variation of population estimates, Canada, provinces and territories, July to September, 2006 and 2007

Increasingly better-distributed immigration

Over the July-September 2007 period, the country took in 71,600 immigrants. That number has been exceeded in the third quarter only once since 1971 (75,900 in 2005). Since the beginning of 2007, the country has welcomed 181,200 immigrants; while high, however, this number is still lower than that of 2006 for the same period (193,400).

Although Ontario remains the most popular destination, that attraction is on the wane. Over the last quarter, Ontario's share of the newcomer population was only 46.5%; this percentage has not been as low since the second quarter of 1984 (46.0%). Usually ranking first with respect to the immigration rate, Ontario stood in fourth place in the last quarter.

Most of the country's other jurisdictions received a similar or higher number of arrivals. For the first time ever, Prince Edward Island boasted the highest immigration rate in Canada (an annualized rate of 12.1 per thousand); next came British Columbia (11.1 per thousand) and Manitoba (10.4 per thousand).

Noticeable increase in the number of non-permanent residents

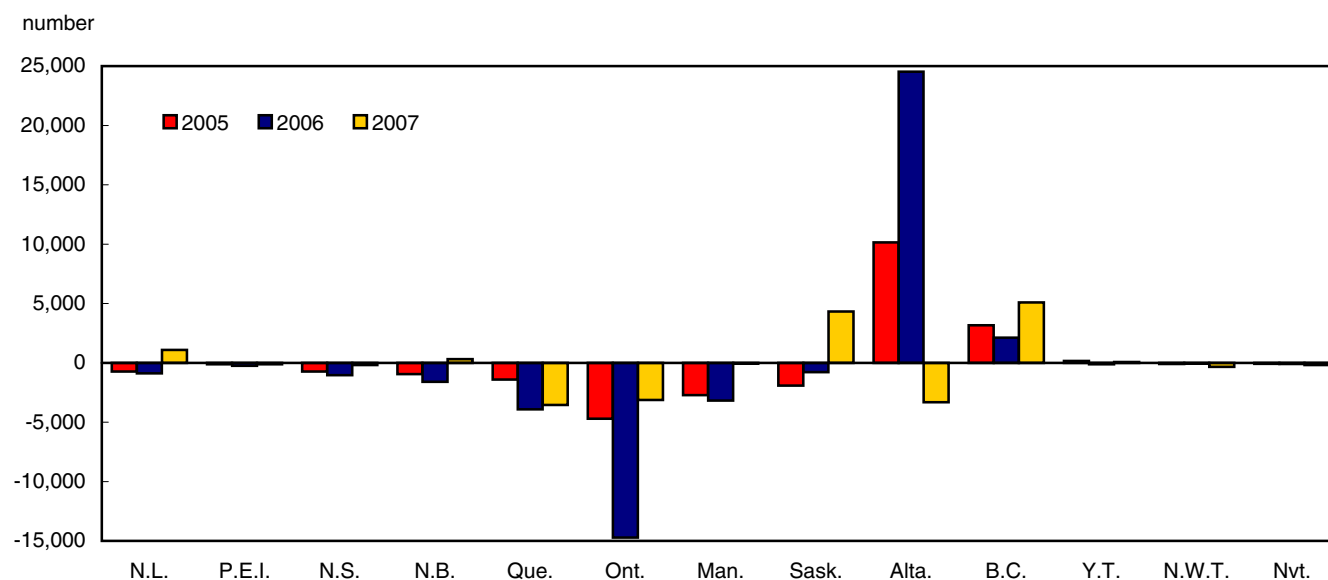

The number of non-permanent residents is also on the rise. Over the last quarter, the figure rose by 22,100 to reach 461,200, a new record. With some exceptions (the Yukon Territory and Northwest Territories), this situation was observed in all jurisdictions. The increase was considerable, especially in Prince Edward Island (15.1%) and Alberta (9.6%).

Interprovincial migration: A trend reversal

For the first time since the fourth quarter of 1994, Alberta posted negative net interprovincial migration. At the same time as the number of interprovincial in-migrants was falling (from 47,400 for the 3rd quarter of 2006 to 29,400 in 2007), the number of people leaving the province rose from 22,800 (3rd quarter of 2006) to 32,700.

Chart 2

Net interprovincial migration, provinces and territories, July to September, 2005 to 2007, Canada

With Alberta's lure fading, most other jurisdictions posted net interprovincial migrations similar to or higher than those for the third quarter of 2006. Only five jurisdictions recorded another negative balance in their exchanges with Alberta: Nova Scotia, Quebec, Ontario, the Northwest Territories and Nunavut. With respect to Nova Scotia and Nunavut, losses were minor. Saskatchewan and British Columbia posted gains in their demographic exchanges with Alberta for the fourth quarter in a row. The case of Ontario and Quebec is unique: even though net interprovincial migration to Alberta was less than last year's for the same period, it remained considerable.

Demographic growth stronger in the West

Despite negative net interprovincial migration, Alberta's population continued to expand thanks to the highest natural growth of all the provinces, as well as a rise in net international migration. Over the last quarter, the population of Alberta rose 0.37%, up slightly over that of Canada as a whole (0.35%).

As has been the case for the past few years, provincial demographic growth was most noticeable west of Quebec. Apart from Manitoba (0.31%), population growth in all provinces was faster than that of the country overall. This group also included the Yukon Territory (0.41%).

Saskatchewan experienced the strongest demographic growth in the entire country (0.65%); as a result, the province's population topped the one-million mark for the first time since July 1, 2001. The province recorded quarterly highs in both international and interprovincial migration. Saskatchewan's net interprovincial migration (+17.3 per thousand) was the highest in the country. Over the last quarter, interprovincial migration accounted for two-thirds of the province's demographic growth. Migration gains from Alberta (+3,400) in large part explain the increase in Saskatchewan's net interprovincial migration (+4,300).

British Columbia now stands second as concerns demographic growth (0.52%), the province's strongest performance since the third quarter of 1996 (0.64%). This growth is essentially due to an increase in British Columbia's net interprovincial migration, which went from +2,100 to +5,100—the highest net interprovincial migration since the third quarter of 1996 (+5,800). The migration gains made by British Columbia at the expense of Alberta (+4,400) account largely for the province's net increase (+5,100).

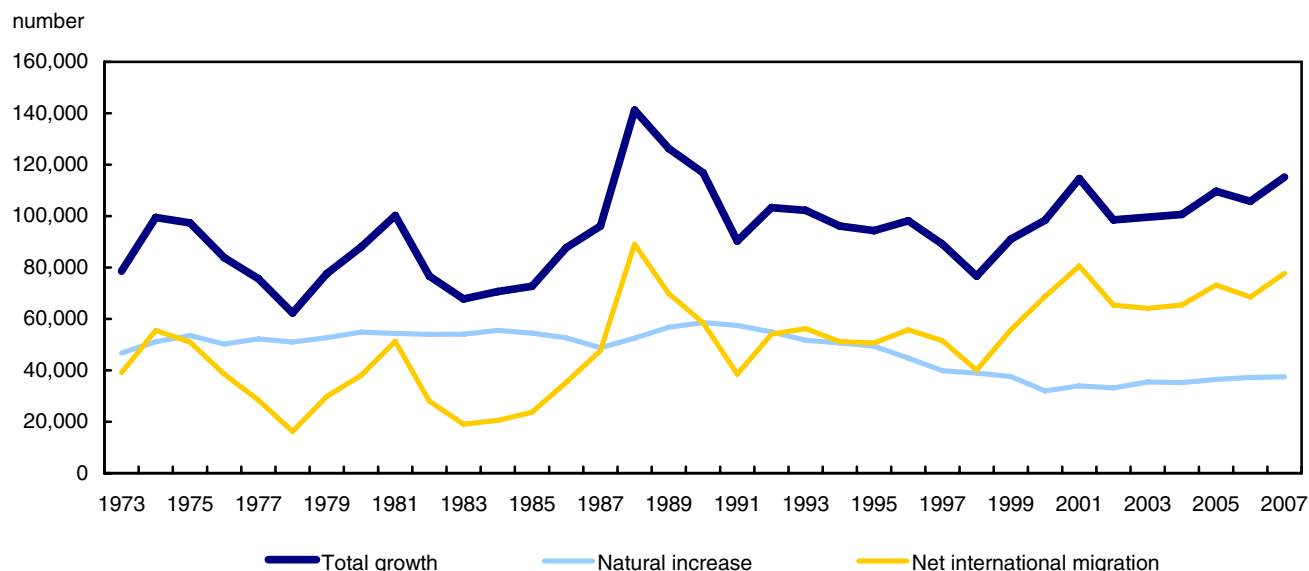

International migration, however, continues to drive British Columbia's demographic growth. Over the last quarter, it explained almost 60% of the province's population increase.

Manitoba had its strongest demographic growth since the third quarter of 1983. This phenomenon has two explanations. First, the province's immigration rate is still among the highest in the country. In addition, its interprovincial migration losses fell from -3,200 to -100 compared to last year at the same time (the smallest losses for a third quarter since 1984 (+100)). Had it not been for its losses to British Columbia (-400), Manitoba's net interprovincial migration would have been positive, reaching levels never seen before.

Varied situations in the territories

In the territories, only the Yukon Territory posted demographic growth higher than that of the country as a whole. That growth can be explained, in part, by an increase in its net interprovincial migration, which was positive for the second consecutive quarter. Because of an increase in interprovincial losses, the Northwest Territories is the only Canadian jurisdiction to experience demographic losses. For the same reasons, Nunavut posted one of the lowest rates of demographic growth in its short history. Only its still-strong birth rate prevented a demographic decline.

Chart 3
Quarterly aggregated demographic components, July to September, 1973 to 2007, Canada

Elsewhere in the country

Elsewhere in Canada, Ontario posted demographic growth higher than that of Canada for the first time since the second quarter of 2006. This growth can be explained, in particular, by a reduction in interprovincial migration losses, which went from -14,700 to -3,100 in relation to the same quarter of 2006. But for its exchanges with Alberta, the province would have recorded positive net interprovincial migration.

Prince Edward Island (0.34%) also stands out, with growth almost equal to that of Canada as a whole. In addition to a decline in interprovincial migration losses, the province experienced an increase with respect to the number of immigrants and non-permanent residents, welcoming a record number of immigrants for a single quarter. Moreover, it had the strongest growth in the country as regards the number of non-permanent residents. It is no surprise, therefore, that Prince Edward Island recorded the strongest rate of net international migration in the country.

Newfoundland and Labrador started growing again for the first time since the third quarter of 2003 (+300). The province's population experienced its strongest growth since the fourth quarter of 1992—a fact that can be explained in particular by interprovincial migration gains (+1,100), a first since the second quarter of 1991. Newfoundland and Labrador not only posted gains in its exchanges with Alberta (+400), but also with the rest of the country (+700).

Over the past three months, the rate of demographic growth in Quebec remained positive, although it is still lower than the one for all of Canada. The province posted its highest growth (0.25%) since the third quarter of 1992 (0.27%). Owing to an increase in the number of births, Quebec's natural growth continues to rise, with the province standing second only to Alberta. Since the beginning 2006, Quebec's rate has been higher than that of Canada as a whole—a phenomenon not observed since the early 1980s.

As compared with last year at the same time, Quebec also posted a slight increase in net international migration, as well as lower losses due to interprovincial migration.

New Brunswick experienced its fourth consecutive quarter of demographic growth, with the rate for the last quarter (0.14%) being the highest observed since the second quarter of 1991 (0.17%). The province's net interprovincial migration was positive for the third quarter in a row. New Brunswick posted interprovincial migration gains with both Alberta (+200) and the country's other jurisdictions taken together (+100).

While its population was declining at the same time last year, Nova Scotia's demographic results were positive in the last quarter. The increase in net interprovincial migration, which went from -1,000 to -200, largely explains this trend reversal.

^p Preliminary data.

Note(s): Preliminary estimates based on data from the Child Tax Benefit (CTB) Program and F_{jk} factors calculated using 2003-2004, 2004-2005 and 2005-2006 tax file data from Canada Revenue Agency.

Methodology

This section describes the concepts, data sources and methodology used to produce the population estimates. Population estimates are produced to measure the population counts according to various characteristics and geographies between two censuses. Population estimates are the official figures used for the count of the population at the national, provincial and territorial levels.

Differences between census counts and population estimates

The population estimates differ from the 2006 Census results published on March 13, 2007, in two respects. First, the estimates are based on 2001 Census counts, adjusted for net census undercoverage (NCU) and updated between censuses using data on births, deaths and migration from administrative sources.

Second, the 2006 Census provides population figures on May 16, 2006, whereas the population estimates present population counts for a later date. Population estimates based on 2006 Census counts adjusted for NCU will be released in the fall of 2008. For further information on this subject, please refer to the *detailed explanation*.

Total population estimates

Types of estimates

Population estimates can be either intercensal or postcensal. Intercensal estimates are produced using counts from two consecutive censuses adjusted for net census undercoverage (NCU) and postcensal estimates. The production of intercensal estimates involves updating the postcensal estimates using the counts from a new census adjusted for NCU.

Postcensal estimates are produced using data from the most recent census adjusted for NCU and the components of population growth. In terms of timeliness, postcensal estimates are more up-to-date than data from the most recent census adjusted for NCU, but as they get farther from the date of that census, they become more variable.

Levels of estimates

Updating population estimates between censuses entails the use of data from administrative files or surveys. The quality of population estimates therefore depends on the availability of a number of administrative data files that are provided to Statistics Canada by Canadian and foreign government departments. Since some components are not available until several months after the reference date, three kinds of postcensal estimates are produced: preliminary postcensal (PP), updated postcensal (PR) and final postcensal (PD). The time lag between the reference date and the release date is three to four months for preliminary estimates and two to three years for final estimates. Though it requires more vigilance on the part of users, the production of three successive series of postcensal estimates is the strategy that best satisfies the need for both timeliness and accuracy of the estimates. All tables indicate the level of the estimates they contain.

Calculation of postcensal population estimates

Population estimates – preliminary, updated and final – are produced by the component method. This method consists in taking the population figures from the most recent census, adjusted for net census undercoverage (NCU) (census undercoverage minus census overcoverage), and adding or subtracting the number of births, deaths, and components of international and interprovincial migration.

A. Provincial / territorial estimates of total population

Population estimates are produced for the provinces and territories first; then they are summed to obtain an estimate of the population of Canada.

The component-method formula for estimating total provincial / territorial populations is as follows:

$$P_{(t+i)} = P_{(t)} + B_{(t,t+i)} - D_{(t,t+i)} + I_{(t,t+i)} - [E_{(t,t+i)} + \Delta TE_{(t,t+i)}] + RE_{(t,t+i)} + \Delta NPR_{(t,t+i)} + \Delta N_{(t,t+i)}$$

where, for each province and territory:

$(t, t+i)$	=	interval between times t and t+i;
$P_{(t+i)}$	=	estimate of the population at time t+i;
$P_{(t)}$	=	base population at time t (census adjusted for (NCU), or most recent estimate);
B	=	number of births;
D	=	number of deaths;
I	=	number of immigrants;
E	=	number of emigrants;
ΔTE	=	net temporary emigration;
RE	=	number of returning emigrants;
ΔNPR	=	net non-permanent residents;
ΔN	=	net interprovincial migration.

B. Levels of estimates

The difference between preliminary¹ and final postcensal population estimates lies in the timeliness of the components. When all the components are preliminary, the estimate is described as preliminary postcensal (PP). When they are all final, the estimate is referred to as final postcensal (PD). Any other combination of levels is referred to as updated postcensal (PR).

Quarterly population estimates are final intercensal up to April 2001, final postcensal from July 2001 to July 2004, updated postcensal from October 2004 to April 2007, and preliminary postcensal from July 2007 on.

Base population and components of population growth

A. Base population

The base populations are derived from the quinquennial censuses between 1971 and 2001. The population universe of the 2001 Census includes the following groups:

- Canadian citizens (by birth or by naturalization) and landed immigrants with a usual place of residence in Canada;
- Canadian citizens (by birth or by naturalization) and landed immigrants who are abroad, either on a military base or attached to a diplomatic mission;
- Canadian citizens (by birth or by naturalization) and landed immigrants at sea or in port aboard merchant vessels under Canadian registry;
- persons with a usual place of residence in Canada who are claiming refugee status and members of their families living with them;

1. In this case, the term *preliminary* include both preliminary and updated estimates.

- persons with a usual place of residence in Canada who hold student authorizations (student visas or student permits) and members of their families living with them;
- persons with a usual place of residence in Canada who hold employment authorizations (or work permits) and members of their families living with them;
- persons with a usual place of residence in Canada who hold Minister's permits (including extensions) and members of their families living with them.

For census purposes, the last four groups in this list are referred to as non-permanent residents(NPR). For further information, please refer to the Glossary in Appendix I.

Foreign residents have not been enumerated since 1991. Foreign residents are persons who belong to the following groups:

- Government representatives of another country attached to the embassy, high commission or other diplomatic body of that country in Canada, and members of their families living with them;
- members of the Armed Forces of another country who are stationed in Canada, and members of their families living with them;
- residents of another country visiting Canada temporarily (for example, a foreign visitor on vacation or on business, with or without a visitor's permit).

The base populations are adjusted as follows (unless otherwise noted, adjustments to the base population apply to both provincial / territorial and subprovincial levels):

- Adjustment of the population for net census undercoverage (NCU);
- addition of independent estimates for incompletely enumerated Indian reserves in 1991, 1996 and 2001;
- adjustment for early enumeration in 1991 and 1996 in parts of northern Quebec, Newfoundland and Labrador, the Yukon Territory and the Northwest Territories;
- addition of estimates of NPRs in 1971, 1976, 1981 and 1986. Since 1991, NPRs included in the census universe;
- estimation of the July 1 base population by addition or subtraction of the components of growth between Census Day and June 30.

Adjustment for net census undercoverage (NCU)

The adjustment for NCU is important. NCU is the difference between the number of persons who should have been enumerated but were missed (undercoverage) and the number of persons who were enumerated but should not have been or who were counted more than once (overcoverage).

Coverage studies provide undercoverage estimates for the 1991, 1996 and 2001 Censuses at the provincial and territorial levels, and for the 1971, 1976, 1981 and 1986 Censuses at the provincial level only. Estimates of overcoverage at the provincial and territorial levels are available only for the last three censuses (1991, 1996 and 2001). Overcoverage for previous censuses was estimated by assuming that the overcoverage-to-undercoverage ratio for each census between 1971 and 1986 was the same as in 1991. The NCU for the Yukon Territory and the Northwest Territories prior to 1991 was estimated by assuming that the ratio between the NCU for each territory and the 10 provinces for each census between 1971 and 1986 was the same as in 1991.

For consistency, 1991 Census undercoverage and overcoverage were revised in 1998 to take into account the methodological improvements made in the 1996 Census coverage studies. This revision altered the NCU in all censuses between 1971 and 1986. Similarly, 1996 Census undercoverage and overcoverage were revised in 2003.

B. Births and deaths

Numbers of births and deaths are derived directly from the vital statistics database of Statistics Canada's Health Statistics Division. Although Statistics Canada manages the National system of vital statistics, the central vital statistics registries of the provinces and territories are responsible for collecting and processing the information from those administrative files. Under provincial / territorial vital statistics statutes (or similar legislation), all live births and all deaths must be registered, and all provinces and territories provide the information to Statistics Canada.

The vital statistics universe closely parallels the census universe. Both universes include births and deaths of all Canadians, immigrants and non-permanent residents (NPR) and exclude foreign residents.

Vital statistics by province or territory of residence are used to produce our final estimates of births and deaths.

When there are no vital statistics, the number of births is estimated using fertility rates by mother's age. The number of deaths is estimated using mortality rates by age and sex. These methods are used to calculate preliminary¹ estimates.

Special treatment for preliminary¹ estimates for Quebec and British Columbia

Quebec and British Columbia provide their most recent estimates of births and deaths. The figures are used to produce preliminary¹ estimates. For the final estimates, the two provinces' births and deaths are derived from the vital statistics compiled by Health Statistics Division.

Levels of estimates

For information on the differences between preliminary¹ and final estimates, see sections **B. Births and Deaths**, above.

Estimates of births are final up to December 2005, updated from January 2006 to March 2007, and preliminary from April 2007 on. Estimates of deaths are final up to December 2004, updated from January 2005 to March 2007, and preliminary from April 2007 on.

C. Immigration

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, immigration is regulated by the *Immigration and Refugee Protection Act* (IRPA) of 2002. This statute superseded the *Immigration Act*, which was passed in 1976 and amended more than 30 times in the years thereafter. *Citizenship and Immigration Canada* (CIC) collects and processes immigrants' administrative files. It then provides Statistics Canada with information from *Field Operational Support System* (FOSS) files. The information is used to estimate the number and characteristics of people granted permanent resident status by the federal government on a given date. For Demography Division, the terms immigrant and permanent resident are equivalent.

An immigrant is a person who is not a Canadian citizen by birth, but has been granted the right to live in Canada permanently by Canadian immigration authorities. The number of immigrants does not include persons born abroad to Canadian parents who are only temporarily outside the country.

Immigrants are usually counted on or after the date on which they are granted permanent resident status or the right to live in Canada.

Levels of estimates

The difference between preliminary¹ and final postcensal estimates lies in the timeliness of the source used to estimate this component. Since the FOSS file is continually being updated, new calculations are carried out each year to update the immigration estimates. Immigration estimates are preliminary the first year and updated the following year. They become final two years after the reference year.

The numbers of immigrants are final up to December 2005, updated from January 2006 to March 2007, and preliminary from April 2007 on.

D. Net non-permanent residents

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, the non-permanent residents (NPR) are regulated by the *Immigration and Refugee Protection Act (IRPA)* of 2002. This statute superseded the *Immigration Act*, which was passed in 1976 and amended more than 30 times in the years thereafter. *Citizenship and Immigration Canada (CIC)* collects and processes the administrative files of immigrants and NPRs in Canada. It then provides Statistics Canada with information from *Field Operational Support System (FOSS)* files. The information is used to estimate the number and characteristics of people granted or permanent resident status by the federal government.

Non-permanent residents (NPR) are persons who are lawfully in Canada on a temporary basis under the authority of a temporary resident permit, along with members of their family living with them. Non-permanent residents (NPR) include foreign workers, foreign students, the humanitarian population and other temporary residents. The humanitarian population includes refugee claimants and temporary residents who are allowed to remain in Canada on humanitarian grounds and are not categorized as either foreign workers or foreign students. For Demography Division, the terms non-permanent resident and temporary resident are equivalent.

Estimates of the number of NPR are based on population estimates. The number of people in CIC's system is estimated on a specific date in each year of observation. First, the end-of-period population is estimated, and then the start-of-period population is subtracted from that estimate. That yields the net number of NPR.

Anyone who received non-permanent resident status prior to the observation date is counted. For refugee claimants, the date of their application is used. Permit holders and refugee claimants are excluded from the population if their permit has expired, if they receive permanent resident status, or if they are deported. In addition, refugee claimants are excluded if their file has been inactive for two years.

Since the FOSS file is continually being updated, the figures are recalculated for each new release period to update the estimates of the net number of NPRs in Canada. Non-permanent residents (NPR) estimates are preliminary the first year and updated the following year. They are finalized two to three years after the reference year, when all other components are also final.

Levels of estimates

The difference between preliminary¹ and final estimates lies in the timeliness of the source used to estimate this component. Since the FOSS file is continually being updated, the figures are recalculated for each new release period to update the estimates of the net number of NPRs. Non-permanent residents (NPR) estimates are preliminary the first year and updated the following year. They become final two to three years after the reference year.

Estimates of the net number of NPR are final up to June 2004, updated from July 2004 to March 2007, and preliminary from April 2007 on.

E. Emigration

The number of emigrants is estimated using data from the *Office of Immigration Statistics, U.S. Department of Homeland Security*, data collected by the *Canada Child Tax Benefit (CCTB)* program, and data from the *T1 Family File (T1FF)*.² The first source is used to estimate emigration to the United States. CCTB data are used to estimate emigration to other countries. The estimates of the number of child emigrants have to be adjusted because the CCTB is not universal and does not provide direct information on the number of adult emigrants. As a result, four adjustment factors are used to take into account:

- Incomplete coverage due to a delay in the receipt and processing of the files of children *eligible* for the CCTB. Since it seems to take four years after the reference period for CCTB administrative files to become complete, the adjustment is made if the estimates are finalized after two years. The factor is derived from the two-year ratios of emigrant children based on two versions of the CCTB files;

2. The T1 family file (T1FF) is derived from the *Canada Revenue Agency (CRA)* T1 file by Small Area and Administrative Data Division of Statistics Canada.

- the program's partial coverage, that is, people who do not apply for the CCTB or are not *eligible*. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to emigrate between children who are *eligible* for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0-17). This factor is calculated for each province and territory and is based on the last three available years of T1FF2;
- the differential propensity to emigrate between adults and children. This factor generates the emigration rate for the population aged 18 and over. It is obtained by (1) calculating the average ratio over three years of the adult and child emigration rates based on T1FF2 data, (2) calculating the average ratio over three years of the adult and child emigration rates based on data from the *Office of Immigration Statistics, U.S. Department of Homeland Security*, and (3) taking the average of the two rates. This factor is calculated for Canada only.

The adult emigration rate is applied to the adult population to generate the number of adult emigrants, which is then added to the number of child emigrants to produce the number of emigrants for the entire population.

Emigration is disaggregated by province and territory based on the number of child emigrants adjusted for coverage and differential emigration.

Levels of estimates

The difference between preliminary¹ and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

The numbers of emigrants are final up to June 2004, updated from July 2004 to March 2007, and preliminary from April 2007 on.

F. Net temporary emigration

Some people leave Canada to live temporarily in another country; others who were temporarily outside Canada return. The net result of those departures and returns is the component known as "net temporary emigration". Estimates of the number of departures are derived from the *Reverse Record Check* (RRC), the most important census coverage study. The RRC provides an estimate of the number of people who left Canada temporarily during an intercensal period and are still out of the country at the end of the period. Estimates of the number of returns are based on two sources: the Census and Demography Division's estimates of returning emigrants. The census provides the number of people who were outside Canada at the time of the previous census and returned during the intercensal period. That number includes all returning emigrants. Then Demography Division's estimate of the returning emigrants' component is subtracted to produce the number of returning temporary emigrants. The estimated numbers of departures (RRC) and returns (Census and Demography Division) yield an estimate of net temporary emigration.

That estimate is for the whole intercensal period; it is disaggregated into estimates for each of the five years in the period and then into monthly estimates using a seasonal adjustment that is an average between zero seasonality and the seasonality of emigration.

Net temporary emigration is calculated first for the national level. It is then disaggregated by province or group of provinces based on the RRC estimates of temporary emigration. For the Atlantic provinces and the territories, the estimate for the group is disaggregated on the basis of each province / territory's proportion of the group's total population.

Net temporary emigration can be estimated only for the intercensal period preceding the most recent census. Net temporary emigration in the current period is assumed to be the same as in the previous period for each province and territory.

Levels of estimates

The difference between preliminary¹ and final estimates lies in the timeliness of the emigration estimate used to calculate the seasonal adjustment for the net temporary emigration. The same estimation method is used.

The estimates of net temporary emigration are final up to June 2004, updated from July 2004 to March 2007, and preliminary from April 2007 on.

G. Returning emigrants

A returning emigrant is a person who returns to Canada after having been classified as an emigrant. In a manner similar to the procedure used to calculate the number of emigrants, data from the *Canada Child Tax Benefit* (CCTB) file and the *Canada Revenue Agency's* (CRA) 's T1FF² are used to estimate the number of returning emigrants. Adjustment factors are applied to compensate for the fact that the CCTB program is not universal, and an adult/child ratio is used to estimate the number of adult returning emigrants. As a result, three adjustment factors are used to take into account:

- The program's partial coverage, that is, people who do not apply for the CCTB or are not *eligible*. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to emigrate between children who are *eligible* for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-*eligible* children with the rates for all children (aged 0-17). This factor is calculated for each province and territory and is based on the last three available years of T1FFs²;
- the adult / child ratio, which is based on the census used in estimating the base population.

Levels of estimates

The difference between preliminary¹ and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

The numbers of returning emigrants are final up to June 2004, updated from July 2004 to March 2007, and preliminary from April 2007 on.

H. Interprovincial migration

Interprovincial migration represents movements from one province or territory to another, involving a change in usual place of residence. As is the case for emigration, there is no provision for recording interprovincial migration in Canada. Consequently, such movements have to be estimated using data from the *Canada Child Tax Benefit* (CCTB) of *Canada Revenue Agency* (CRA) and the T1FF.²

Final estimates of interprovincial migration are obtained by comparing addresses indicated on personal income tax returns over two consecutive tax years. However, the migration status of taxfilers' dependants has to be imputed. An adjustment is also required to take into account migrants who do not file income tax returns. For 2001-2002 and subsequent years, the adjustment was slightly modified (for further information, see *Wilkinson, 2004*).

Since income tax returns are not available at the time preliminary estimates are produced, the estimation of preliminary¹ interprovincial migration is based on CCTB administrative files, which provide counts of child migrants (aged 0-17) *receiving benefits* under the program. The estimates have to be adjusted later for children who are not receiving the CCTB. Finally, the number of adult migrants is calculated using the number of child migrants and factors derived from the T1FF.² As a result, three adjustment factors are used to take into account:

- The program's partial coverage, that is, people who do not apply for the CCTB or are not receiving *benefits*. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;

- the differential propensity to migrate between children who are receiving the CCTB and children who are not. This factor is obtained by comparing the out-migration rates of children receiving the CCTB with the rates for all children (aged 0-17). This factor is calculated for each province and territory and is based on the last available year of T1FFs²;
- the differential propensity to migrate between adults and children. This factor generates the out-migration rate of the population aged 18 and over for each province / territory of origin and destination. It is obtained by calculating the ratio of the central migration rate for adults to the rate for children. It is estimated using data from the last three available years of T1FFs.²

The adult migration rate is then applied to the estimated adult population. The number of adult migrants is then added to the number of child migrants to produce the number of interprovincial migrants for the entire population.

Levels of estimates

For information on the differences between preliminary¹ and final estimates of total interprovincial migration, see section **H. Interprovincial migration** above. For all levels of estimates, the age-sex distribution is based on the 2001 Census one-year mobility question and data from the T1FF.²

The estimate of interprovincial migration is final up to June 2006 and preliminary from July 2006 on.

Intercensal population estimates

Intercensal estimates – population estimates for reference dates between two censuses – are produced following each census. They reconcile previous postcensal estimates with the new census counts.

There are two main steps in the production of intercensal estimates:

- Calculation of the error of closure;
- linear distribution of the error of closure.

Error of closure is defined as the difference between the postcensal population estimates on Census Day and the population enumerated in that census (after adjustment for net census undercoverage (NCU)).

The error of closure is spread uniformly over the intercensal period.

Quality of estimates

Post-2001 postcensal population estimates

The postcensal estimates contain certain inaccuracies stemming from:

- (a) errors in the 2001 Census data (the base population on which these estimates were constructed) and
- (b) imperfections in other data sources and the method used to estimate the components.

Errors in census data

Census data for total population by province or territory are affected by coverage errors. These errors occur when dwellings and/or individuals are missed, incorrectly included or counted more than once. Following each census, Statistics Canada undertakes coverage studies to measure these errors. The main study are the Reverse Record Check Survey (RRC) and the Census Overcoverage Study (COS). Based on these studies, estimates of net undercoverage (which is equal to the difference between undercoverage and overcoverage) are produced. Demography Division adjusts the population enumerated in the census by province and territory using these estimates.

Text table 1

Estimated net undercoverage of population for Canada, provinces and territories, 1996 and 2001 Censuses

	1996 ¹		2001 ¹	
	Number	Rate in percent	Number	Rate in percent
Canada	712,119	2.41	958,969	3.10
Newfoundland and Labrador	8,840	1.58	9,401	1.80
Prince Edward Island	896	0.66	1,325	0.97
Nova Scotia	21,126	2.27	24,521	2.63
New Brunswick	14,073	1.87	20,095	2.68
Quebec	102,680	1.42	152,880	2.07
Ontario	304,139	2.75	452,309	3.81
Manitoba	19,052	1.68	31,013	2.70
Saskatchewan	28,599	2.81	21,812	2.18
Alberta	71,971	2.60	74,834	2.45
British Columbia	137,446	3.56	164,805	4.05
Yukon Territory	467	1.50	1,423	4.73
Northwest Territories	1,979	4.75	3,295	8.11
Nunavut	851	3.33	1,256	4.49

1. The levels and rates are based on the Reverse Record Check (RRC) and the Overcoverage Study and include non-permanent residents.

The adjustment also incorporates the results of a study on the estimates of the number of people living on incompletely enumerated Indian reserves to complete the corrections for coverage errors in the census. The results of the coverage studies contain mainly sampling errors. For further information regarding the main coverage studies, please see the following document on Statistics Canada's web site: 2001 Census Technical Report on Coverage.

Errors coming from methodology and other data sources

Errors due to estimation methodologies and data sources other than the census are can also be significant.

Since the law requires the recording of vital statistics, births and deaths data meet very high standards. Nevertheless, since preliminary estimates are derived, they can be slightly different from final estimates.

With respect to immigrants and non-permanent residents, Citizenship and Immigration Canada administers special data files on both of these components. Since immigration is controlled by law (the Immigration Act), data on immigrants and non-permanent residents are compiled upon arrival in Canada. These data represent only "legal" immigration and exclude illegal immigrants. Thus, for the "legal" part of international movement into Canada, the data are considered to be of high quality.

However, some biases such as the difference between the stated province of intended residence at the time of arrival and the actual province of residence, may persist. Finally, since information provided by the Visitor Data System from Citizenship and Immigration Canada is not complete (age and sex of dependents, province of residence for certain groups of permit holders), estimates of nonpermanent residents are more prone to error than data on immigrants.

Estimates of the number of emigrants and returning emigrants are both derived using Child Tax Benefit (CTB) data provided by Canada Revenue Agency (CRA). Data are adjusted to take into account the incomplete coverage of the CTB program and to derive the emigration and returning emigration of adults. These adjustments and the delay in obtaining the data are the two main sources of errors.

As current information on the number of persons living temporarily abroad does not exist, estimates are based on the Reverse Record Check (RRC) and the census. Estimates for the intercensal period, distributed equally among the five years, are maintained constant for the postcensal period. Provincial/territorial distributions are obtained from RRC. Moreover, assumptions were made to allow for the distribution of annual to a quarterly level. Any geographical or quarterly variation may introduce error in the estimation of these components.

While preliminary estimates of interprovincial migration are produced using data from the Child Tax Benefit (CTB) program, final estimates are calculated from the annual taxfile received from Canada Revenue Agency (CRA). Since the two estimates of interprovincial migration are produced from different sources of information, they are more subject to error.

Quality assessment

In order to assess the quality of our estimates, two evaluation measures are used : precocity errors and errors of closure.

Precocity errors

The quality of preliminary estimates of components is analysed using precocity errors. Precocity error, which is calculated on a quarterly basis, is defined as the difference between preliminary and final estimate of a particular component in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for both population and component estimates.

Precocity error allows for useful comparisons between components, as well as between provinces and territories or geographical areas of different population size. Note that when compared to the total population for an area, the differences between preliminary and final estimates of the components are quite small. There are, however, differences in the amount of impact on the population estimates between components and between provinces and territories.

Generally speaking, net interprovincial migration yields the greatest precocity errors. This is likely the result of the use of different data sources for preliminary and final estimates of interprovincial migration. In most years and for most provinces/territories, births, deaths and immigration estimates yielded the smallest precocity errors. For immigration estimates, this reflects the completeness of the data source and the availability of data for the more timely preliminary estimates. In the case of births and deaths, small precocity errors support the use of short-term projections for preliminary estimates.

According to the analysis of the most recent precocity errors and assuming that the quality of the basic data remains constant, the present postcensal estimates should have an acceptable degree of reliability.

Errors of closure

The error of closure measures the exactness level of the final postcensal estimates. It can be defined as the difference between the enumerated population of the most recent census (after adjustments for net undercoverage) and the most current postcensal population estimates as of census day.

The error of closure comes from two sources: differences in the amount of net undercoverage and errors in the components of population change over the intercensal period. This can be calculated for population estimates and for age, sex and marital status. With each 5-year intercensal period, the error of closure can only be calculated with the release of census data and estimates of net undercoverage.

By dividing the error of closure by the adjusted census population rates are relatively small at the national level (0.38% for 1996 and 0.15% for 2001). At the provincial and territorial level, differences are understandably larger, since the estimates are also affected by errors in estimating interprovincial migration. Nevertheless, the provincial/territorial final postcensal estimates generally fall within 1% of the adjusted census population.

Text table 3

Error of closure of the estimates of total population for Canada, provinces and territories, July 1, 1996 and 2001

	1996		2001	
	Number	Rate in percent	Number	Rate in percent

Quebec	96,449	1.33	-320	0.00
Ontario	56,479	0.51	8,857	0.07
Manitoba	-852	-0.08	-1,121	-0.10
Saskatchewan	-7,400	-0.73	15,952	1.59
Alberta	-8,124	-0.29	714	0.02
British Columbia	-43,313	-1.12	-4,357	-0.11
Yukon Territory	-244	-0.78	-354	-1.18
Northwest Territories	-42	-0.10	481	1.18
Nunavut	-868	-3.39	46	0.16

Note(s): The error of closure is equal to the July 1 postcensal estimate minus the census count adjusted to July 1 and for net census undercoverage. The percentage is: error of closure, divided by the census count adjusted to July 1 and for net census undercoverage, multiplied by 100.

Explanatory notes for the tables

Table3

Quarterly population estimates and aggregated demographic components

Population	Population estimates are final postcensal from July 1, 2001 to July 1, 2004, updated postcensal from October 1, 2004 to April 1, 2007 and preliminary postcensal from July 1, 2007.
Natural increase	Natural increase is final up to December 2004, updated from January 2005 to March 2007 and preliminary from April 2007.
Interprovincial migration	Net interprovincial migration numbers are final up to June 2006 and preliminary from July 2006.
International migration	Net international migration numbers are final up to June 2004, updated from July 2004 to March 2007 and preliminary from April 2007.
Total migration	Total net migration numbers are final up to June 2004, updated from July 2004 to March 2007 and preliminary from April 2007.
Total growth	Numbers for total growth are final up to June 2004, updated from July 2004 to March 2007 and preliminary from April 2007.

Table4

Quarterly estimates of demographic components

Births	The numbers of births are final up to December 2005, updated from January 2006 to March 2007 and preliminary from April 2007.
Deaths	The numbers of deaths are final up to December 2004, updated from January 2005 to March 2007 and preliminary from April 2007.
In-migrants	The numbers of interprovincial in-migrants are final up to June 2006 and preliminary from July 2006.
Out-migrants	The numbers of interprovincial out-migrants are final up to June 2006 and preliminary from July 2006.
Immigrants	The numbers of immigrants are final up to December 2005, updated from January 2006 to March 2007 and preliminary from April 2007.
Emigrants	The numbers of emigrants are final up to June 2004, updated from July 2004 to March 2007 and preliminary from April 2007.
Returning emigrants	The numbers of returning emigrants are final up to June 2004, updated from July 2004 to March 2007 and preliminary from April 2007.
Net temporary emigrants	The numbers of net temporary emigrants are final up to June 2004, updated from July 2004 to March 2007 and preliminary from April 2007.
Net non-permanent residents	The numbers of net non-permanent residents are final up to June 2004, updated from July 2004 to March 2007 and preliminary from April 2007.

Appendix I

Glossary

Annualized rate

Refers to the ratio of the estimated number of events converted to an annual basis divided by the average quarterly populations. In this respect, birth, death, immigration rates, etc are calculated. Generally, the rate is expressed in per 1,000.

Census coverage

Net undercoverage: Difference between undercoverage and overcoverage.

Overcoverage: Number of persons who should not have been counted in the census or who were counted more than once.

Undercoverage: Number of persons who were intended to have been enumerated in a census but were not enumerated.

Components of demographic growth

Any of the classes of events generating population movement variations. Births, deaths and migrations are the components responsible for the variation since they alter the total population.

Emigrants

Canadian citizen or **immigrant** who has left Canada to establish a permanent residence in another country.

Error of closure

Difference between the **postcensal estimate** for the same date as the census and the results of the census adjusted for **net undercoverage**.

Immigrant

Within the framework of this publication, the term immigrant refers to **landed immigrant**. A landed immigrant is a person who does not have Canadian citizenship but was granted the right by immigration authorities to live in Canada on a permanent basis.

International migration

International migration represents movement of population between Canada and a foreign country which involves a change in the usual place of residence. A distinction is made with regard to **immigrants, emigrants, returning emigrants, net temporary emigrants** and **net non-permanent residents**.

Interprovincial migration

Interprovincial migration represents movement from one province or territory involving a permanent change in residence. A person who takes up residence in another province or territory is an **out-migrant** with reference to the province or territory of origin and an **in-migrant** with reference to the province or territory of destination.

Natural increase

Variation in population size over a given period as a result of the difference between the numbers of births and deaths.

Net international migration

Net international migration is obtained according to the following formula: **Immigrants + returning emigrants + net non permanent residents – (emigrants + net temporary emigrants)**

Net interprovincial migration

Net interprovincial migration represents the difference between **in-migrants** and **out-migrants** for a given province or territory.

Net non-permanent residents

Net non-permanent residents represent the variation in the number of non-permanent residents between two dates.

Non-permanent residents

A non permanent resident belongs to one of the five following groups:

- persons residing in Canada claiming refugee status;
- persons residing in Canada who hold a study permit;
- persons residing in Canada who hold a work permit;
- persons residing in Canada who hold a minister's permit;
- all non-Canadian born dependants of persons claiming refugee status, or of persons holding study permits, work permits or minister's permits and living in Canada.

Net temporary emigration

Net temporary emigration represents the variation in the number of temporary emigrants between two dates. Temporary emigration includes Canadian citizens and **immigrants** living temporarily abroad who have not maintained a usual place of residence in Canada.

Population

Estimated population and population according to the census are both defined as being the number of Canadians whose usual place of residence is in that area, regardless of where they happened to be on Census Day. Also included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered **non-permanent residents**.

Population estimate

- (a) **postcensal**: Population estimate produced by using data from the most recent available census adjusted for **net undercoverage** and estimate of the **components of demographic growth** since that last census. This estimate can be preliminary, updated or final.
- (b) **intercensal**: Population estimate derived by using **postcensal estimates** and data adjusted for **net undercoverage** of censuses preceding and following the year in question.

Population growth or total growth

Variation of population size between two dates. It can also be obtained by summing the **natural increase**, **total net migration** and if possible, **residual deviation**. It can be positive or negative.

Residual deviation

Difference between demographic **population growth** calculated using **intercensal estimates** of population between two dates and that obtained by the sum of the components for the same period. This deviation results from the distribution of the **error of closure** between years within the quinquennial period.

Returning emigrants

Canadian citizen or **immigrant** having previously emigrated from Canada and subsequently returned to the country.

Total net migration

Sum of **net international** and **net interprovincial** migration.

Vital events

Includes all the demographic events (that is to say births, deaths, marriages and divorces) for which there exists a legal requirement to inform the Provincial or Territorial Registrar's Office.

Appendix II

Source and remarks

Base population

May 15, 2001 Census of Population, adjusted to July 1 and for net undercount.

Statistics Canada, **Census of Canada, 2001**, Catalogue no. 93-360-X.

Births and deaths

Statistics Canada, Health Statistics Division.

Statistics Canada, Demography Division, Catalogue no. 91-002-X, Quarterly, Analytical table 5.

Immigration

Citizenship and Immigration Canada

Emigrants

Statistics Canada, Demography Division - from data on emigrant children from the Child Tax Benefit program (CTB) from Canada Revenue Agency files - CRA and data from the "U.S.Department of Homeland Security, Office of Immigration Statistics"

Returning emigrants

Statistics Canada, Demography Division – based on data from the CTB program and adjustment factors calculated using CRA files.

Net temporary emigrants

Statistics Canada, Demography Division – based on data from the Reverse Record Check (RRC), 1996 and 2001 Censuses of Canada.

Non-permanent residents

Statistics Canada, Demography Division – based on data provided by Citizenship and Immigration Canada.

Interprovincial migration

Statistics Canada, Demography Division – based on the CTB program and adjustment factors calculated using CRA files.
